Summary

DevOps / Platform Engineer with 9 years across technology, including platform engineering, CI/CD and test automation. I build infrastructure on AWS and Google Cloud Platform with Terraform and AWS CDK, and edge services on Akamai EdgeWorkers. Focused on cutting costs, improving reliability and building self-service tools that remove engineering bottlenecks. Currently learning Kubernetes and Microsoft Azure, and experimenting with how prompt loops can accelerate development workflows.

Professional Experience

Kmart Australia
DevOps Engineer July 2024 – Present

Cost optimisation and FinOps

- Initiated and delivered a Redis to Valkey migration on AWS ElastiCache ahead of Redis end-of-life, avoiding extended support charges and reducing caching costs by 70% (approximately AUD 20,000 per year from January 2027), with no application rewrites.
- Implemented Amazon ECR lifecycle policies to automatically expire unused container images, reducing storage costs by approximately AUD 10,000 per year.
- Contributed to the Imperva to Akamai CDN and WAF harmonisation for kmart.com.au, consolidating vendors and reducing costs across the Kmart Group.

Platform and AI infrastructure

- Delivered Kmart's first production applications on Google Cloud Platform, Joy (a Gemini-powered generative AI shopping assistant) and Vertex AI Search for Commerce, taking each from proof of concept to production in 3 weeks on aggressive timelines, using newly released GCP AI products with many unknowns.
- Built end-to-end GCP infrastructure, CI/CD pipelines and CDN configuration for Joy using Terraform.
- Built GCP infrastructure for the Constructor.io to Vertex AI Search for Commerce migration, including Cloud Run, load balancers, Cloud Armor, Certificate Manager, a token service, canary deployments and Akamai traffic routing.
- Negotiated GCP security architecture with the security team (DNS, internal domain reuse, Google-managed certificate ownership) and enabled keyless Buildkite deployments via Workload Identity Federation (WIF).
- Diagnosed and remediated performance issues, including approximately 1,900 ms of search latency caused by CDN tiered distribution routing through US points of presence, and drove the APAC fix with Akamai.
- Led a VPC migration of the consent management system, integrated with Tealium and Braze, using a blue/green deployment strategy, the first use of blue/green deployment within Kmart Digital, achieving zero downtime.

Edge engineering and security

- Led solution architecture for Kasada bot protection using Akamai EdgeWorkers Flexible Composition, with automated regression coverage and fault injection tests to validate resilience and failure handling.
- Negotiated with the security team to enable Akamai pragma debug headers under IP allowlisting and required-header controls, unblocking automated test coverage that guards CDN and EdgeWorker functionality from regressions.
- Main contributor to a CDN-as-code repository, managing Akamai property configuration and EdgeWorkers as code, with automated regression tests in CI/CD.
- Delivered Kmart's first production Akamai EdgeWorker (visitor ID), and led the investigation that showed true median latency was about 95 ms rather than the reported 800 ms, correcting a measurement error in RUM instrumentation.
- Supported Akamai WAF and Bot Manager tuning and a firewall cutover.

Developer enablement and self-service

- Identified the need for and built a self-service Akamai cache purge tool for the online merchandising team, secured with Microsoft Entra ID single sign-on (SSO) and a full audit trail, cutting purge turnaround from 10–15 minutes (or next business day after hours) to seconds. The team ran 695 purges in the first 3 months, saving an estimated 115–170 hours of waiting and 695 engineer interruptions.
- Built a self-service Redis cache purge CLI so feature teams no longer SSH into a host in the Redis VPC.
- Built a Playwright test automation framework integrated with CI/CD and adopted by 4 squads, migrating from WebdriverIO and cutting regression suite runtime by 75%, from 40 minutes to 10 minutes.
- Built a serverless personalisation API platform on AWS with GitHub Actions, CDK scaffolding for API Gateway and Lambda endpoints, and Sumo Logic observability built in.
- Built an Express mock service on Amazon ECS so teams can develop against endpoints before real services exist.

Performance and reliability

- Led Availability Zone (AZ) disaster recovery testing for the Kmart website using AWS Fault Injection Service, covering scoping, observability dashboards, performance tests and automated functional tests to validate recovery.

- Identified and remediated the platform issues that had prevented recovery from an AZ failure, taking the platform from no recovery to full recovery within a 3-minute Recovery Time Objective (RTO).
- Led performance testing for Peak trading readiness using JMeter, validating platform capacity ahead of the highest-traffic period of the year.
- Designed a token toggle supporting both real and forged authentication tokens, with production safeguards, enabling load testing of authenticated customer journeys without disrupting test environments.
- Built test data generation scripts for performance testing, reducing test preparation time from hours to minutes.
- Participated in incident response as part of the on-call rotation, and led the root cause analysis (RCA) of a cascading failure across production ECS microservices.
- Led the Recommender API migration for service stability, and built New Relic and Sumo Logic observability.

Leadership and mentoring
- Mentored a graduate engineer and built a dotfiles bootstrapper to speed up engineer onboarding.

Kmart Australia
Software Test Engineer September 2021 – July 2024

- Core maintainer of the Kmart Online test automation framework, migrating WebdriverIO from synchronous to asynchronous and adding linting, logging and end-to-end email testing, improving suite stability.
- Moved the automation suite from manual QA-triggered runs into Buildkite CI/CD, enabling automated regression testing on every pipeline run.
- Migrated functional tests to run against stubs using WireMock, reducing runtime by 90%, from 30 minutes to 3 minutes for 50 tests.
- Core contributor to the performance test suite for Peak trading readiness.

Two Bulls
Senior QA Engineer September 2019 – August 2021
QA Engineer May 2017 – September 2019

- Created and maintained CI/CD pipelines for iOS, Android, web and game engine projects using Jenkins, GitLab CI/CD, Bitrise, GitHub Actions and Fastlane, including code signing and automated release deployment to the App Store and Google Play.
- Migrated Jenkins jobs to version-controlled declarative pipelines (pipeline as code), and maintained the on-premises Jenkins build infrastructure for a cross-platform video SDK.
- Designed an automated smoke testing solution on AWS (Lambda, S3, CloudWatch, CodePipeline, Device Farm), provisioned with CloudFormation.
- Built scripts to automate test build installation on iOS, Android and embedded devices, cutting test setup time from minutes to seconds.
- Owned test strategy, test creation, execution and automation for web and native mobile applications in agile and waterfall environments, using Cypress, Appium and XCUITest.
- Selected clients: Service Victoria, Beyond Blue, Scouts Australia, Verizon, Sesame Street, The Wiggles, 28 By Sam Wood.

Technical Skills

AWS: EC2, ECS, ECR, Lambda, API Gateway, Application Load Balancer, VPC, Route 53, S3, CloudFront, IAM, DynamoDB, ElastiCache, SQS, SNS, Systems Manager, Fault Injection Service
Google Cloud Platform: Cloud Run, Cloud Load Balancing, Cloud Armor, VPC, IAM, Workload Identity Federation, Cloud Storage, Storage Transfer Service, BigQuery, Cloud Monitoring, Vertex AI Search, Gemini Enterprise for Customer Experience
Infrastructure as Code: Terraform, AWS CDK, CloudFormation
CDN: Akamai EdgeWorkers, Flexible Composition, Property Manager, WAF, Bot Manager; Imperva
CI/CD: Buildkite, GitHub Actions, GitLab CI/CD, Bitrise, Jenkins, AWS CodePipeline, Bitbucket Pipelines, Fastlane; blue/green and canary deployments
Languages and platforms: TypeScript, Python, Bash, Git, Linux, Docker
Testing: Playwright, Jest, Vitest, Supertest, Cypress, Appium, Cucumber, WireMock
Performance testing: JMeter, k6, Locust, Lighthouse
Observability: New Relic, Datadog, Sumo Logic, Amazon CloudWatch
Security and identity: AWS Secrets Manager, Wiz, Snyk, Kasada, Auth0, Microsoft Entra ID, SSO
APIs, data and integrations: REST, GraphQL, Redis, Valkey, Contentful, Tealium, Braze
AI and developer tools: Cursor CLI (AI coding agent), AWS DevOps Agent, AWS Security Agent, Neovim, tmux
Practices: TDD, BDD, pair programming, code review, Agile (Scrum, Kanban), CI/CD, infrastructure as code, incident response and on-call, root cause analysis, disaster recovery testing, FinOps

Education and Training

RMIT University – Bachelor of Electrical Engineering / Bachelor of Commerce 2012 – 2017
OWASP AppSec Day – Web Hacking Essentials November 2019
